Software Engineering Program

Alfaisal University, College of Engineering & Advanced
Computing

Effective: Fall 2025

Approved: March 2025

Revised: April 2026

Curriculum Structure and Study Plan

The Software Engineering curriculum is composed of **130** Credit Hours (CRHs) divided as follows:

I. University General Education Requirements (19 CRHs)

1. Arts & Humanities (6 CRHs)
2. Social Sciences (9 CRHs)
3. Sciences (4 CRHs)

II. Major Requirements (111 CRHs)

1. Core Major Requirements (99 CRHs)
2. Technical Electives (12 CRHs)
3. Summer Internship (0 CRHs)

I. University General Education Requirements (19 CRHs)

1. Arts & Humanities (6 CRHs)

Course Code	Course-Title	Credit Hours (CRHs)				Prerequisite Course Code	Co-Requirement Course Code
		Total-CRHs	Lect.	Lab	Tut		
ENG 101	University Writing	3	3	0	0		
ENG 222	Technical Writing	3	3	0	0	ENG 101	

2. Social Sciences (9 CRHs)

Course Code	Course-Title	Credit Hours (CRHs)				Prerequisite Course Code	Co-Requirement Course Code
		Total-CRHs	Lect.	Lab	Tut		
_____	Social Sciences Elective I*	3	3	0	0		
_____	Social Sciences Elective II *	3	3	0	0		
_____	Social Sciences Elective III*	3	3	0	0		

* Select any three 3-CRHs courses (i.e., 9 CRHs in total) from the University-approved list of Social Sciences courses.

3. Sciences (4 CRHs)

Course Code	Course-Title	Credit Hours (CRHs)				Prerequisite Course Code	Co-Requirement Course Code
		Total-CRHs	Lect.	Lab	Tut		
SE 100	Programming for Engineers	3	3	0	0		SE 100L

Software Engineering - CoE & Advanced Computing

SE 100 L	Programming for Engineers Lab	1	0	2	0		SE 100
-----------------	--	----------	----------	----------	----------	--	---------------

II. Major Requirements (111 CRHs)

1. Core Major Requirements (99 CRHs)

Course Code	Course-Title	Credit Hours (CRHs)				Pre-Requisite Course Code	Co-Requisite Course Code
		Tot al- CR Hs	Lect	Lab	Tut		
MAT 101	Calculus I	3	3	0	2		
MAT 112	Calculus II	3	3	0	2	MAT 101	
MAT 212	Linear Algebra	3	3	0	0	MAT 112	
MAT 224	Numerical Methods	3	3	0	0	MAT 212	
STA 212	Probability and Statistics	3	3	0	0	MAT 112	
PHU 103	Physics I	3	3	0	1		MAT 101, PHU 103L

Software Engineering – Tracks

Bachelor of Science in Software Engineering – Game Development and Digital Media Track

Game design is a combination of art, craft, and science. By designing, creating, and evaluating games, students in the Game Development and Digital Media Track will become experts in all three aspects. Students in this track learn the conceptual, aesthetic, and technical aspects of game creation that serve as a foundation for game design. This track provides a foundation in game design and software development principles. Students develop core competencies, collaborate on the design and development of game projects, and engage in authentic, situated, creative problem-solving to broaden their horizons as interdisciplinary team members.

Track Course Requirements (16 CRHs):

The following are the core courses required in Game Development and Digital Media Track:

- SE 324 Web Application Development (Prerequisites: SE252)
- SE 324 L Web Application Development Lab
- SE 461 – Game Engine Architecture and Implementation (Prerequisites: SE328)
- SE 462 – Fundamentals of Game Design (Prerequisite: SE 310)
- SE 463 – Game Mechanics, Prototyping, and Production (Prerequisite: SE 412)
- SE 464 – Innovative Topics in Immersive Game Development (Prerequisite: SE 324)

There are no elective courses for this track. All the above courses need to be completed to graduate with this track.

Course Descriptions

In this section, we give brief descriptions of courses in the Software Engineering program. Each course below follows the following format:

Course code: Course Title Course credit hours (Lecture contact hours – Lab contact hours – Tutorial contact hours)

Course Description

Prerequisite(s)

Co-requisites

Core Courses

CoE 100: Student Orientation & Academic Success

1 (1-0-0)

This course introduces students in the College of Engineering (CoE) to their rights and responsibilities as a student at the CoE and develops their skills to foster academic success. Students will develop a thorough understanding of the academic policies and procedures applicable to the CoE Students, including policies and procedures related to attendance vs participation, academic integrity, academic probations, outside studies programs and credit transfer, grade appeals, GPA calculations, repeating courses, make-up exams, sick-leave, student advising, etc. The course will also familiarize students with their study plans, including requirements for adding a minor or a double major; equip them with the skill required to access and utilize the rich library resources; introduce them to the set of extracurricular activities available at Alfaisal; and enhance their time management and study skills. The course will be delivered as a combination of online and face-to-face sessions. It will use online resources as well as guest speakers to educate students on the important aspects of their academic life.

Prerequisite(s): None

SE 100: Programming for Engineers

3 (3-0-0)

The course introduces the students to basic notions of computers and computing and then introduces them to programming starting from abstract ways like flowcharts and pseudocode and finally using a typical programming language. The students will be introduced to the basic concepts of data types and structures, operators, and the different ways of data storage, manipulation, and representation.

Emphasis is on problem-solving and structured program design methodologies.

Prerequisite(s): None

Co-requisites: SE 100L

SE 100 L: Programming for Engineers Lab

1 (0-2-0)

This course constitutes the lab component of the Programming for Engineer course (SE 100). The purpose of this lab is to provide hands-on training on programming concepts, technologies and techniques introduced during lectures.

Prerequisite(s): None

Co-requisites: SE 100

SE 120: Object-Oriented Programming I

3 (3-0-0)

After completing this course, students will be equipped with the necessary skills and tools to write programs in Java based on a procedural and object-oriented approach. Topics of focus will include basic Java programming, conditional statements, strings, iteration, methods, arrays, creating classes, encapsulation, inheritance and polymorphism, abstract classes, packages, principles of object-oriented design, as well as exceptions and interfaces.

Prerequisite(s): SE 100

Co-requisites: SE 120L

SE 120 L: Object-Oriented Programming I Lab **1 (0-2-0)**

This course constitutes the lab component of the Object-Oriented Programming I course (SE 120). The purpose of this lab is to provide hands-on training on the basics of Java and advanced object-oriented programming. Topics covered include data types and operators, logical expressions, control structures, methods, arrays, inheritance; polymorphism; abstract classes and interfaces. be covered.

Prerequisite(s): None

Co-requisites: SE 120

SE 201: Introduction to Software Engineering **3 (3-0-0)**

This course is designed to present students with several principles relevant to Software Engineering. Students will gain insights into various software process models throughout the course. The curriculum strongly emphasizes the agile software development approach, highlighting the importance of adaptability and collaborative teamwork. Students will acquire knowledge and skills in requirements engineering. The course covers systems modeling and project management strategies. It addresses the value of software reuse and introduces students to human computer interaction and software testing. The final segment of the course focuses on configuration management.

Prerequisite(s): SE 120

SE 151: Discrete Mathematics **3 (3-0-0)**

This course covers the mathematical elements of computer science including formal logic, propositional logic, predicate logic, logic in mathematics, sets, functions and relations, recursive thinking, mathematical induction, counting, combinatorics, algorithms, matrices, graphs, trees, and Boolean logic. Students will learn to recognize and express mathematical ideas graphically, numerically, symbolically, and in writing.

Prerequisite(s): SE 100

SE 215: Data Structures **3 (3-0-0)**

The course involves the study of important data structures and sorting methods commonly encountered in object-oriented software engineering. It covers the design, performance analysis, and implementation of the related algorithms, stressing their practical use and performance.

Prerequisite(s): SE 120

Co-requisites: SE 215L

SE 215 L: Data Structures Lab **1 (0-2-0)**

Survey of important computer algorithms and related data structures used in object-oriented software engineering. Design, performance analysis and implementation of such algorithms, stressing their practical use and performance certification of large software applications. Understand how to "seal" designs to guarantee performance goals and ensure that all error conditions are caught. Laboratory experiments dealing with Algorithms and Data Structures.

Prerequisite(s): None

Co-requisites: SE 215

SE 220: Object-Oriented Programming II **3 (3-0-0)**

This course should provide students with all necessary skills and tools to develop applications based on an object-oriented approach. Topics of focus will include GUI, event-driven programming, advanced GUI, text and binary I/O.

Prerequisite(s): SE 120

Co-requisites: SE 220L

SE 220 L: Object-Oriented Programming II Lab

1 (0-2-0)

This lab should provide students with all necessary hands-on practice on Object oriented II with a good review of Object oriented I basics to build GUI applications that can help students in solving more complex problems. Laboratory experiments dealing with advanced Object-Oriented Programming.

Prerequisite(s): None

Co-requisites: SE 220

SE 225: Software Requirements

3 (3-0-0)

Introducing key aspects of the requirements process, starting with the creation of a vision document, and establishing project scope. Elicitation techniques, system context and use case modeling, and the seamless transition from use cases to implementation and test cases will be introduced. Crucial topics will be covered like misuse case modeling, prototyping, fundamentals of goal orientation, requirements management, change management, and the creation and validation of supplementary specifications.

Prerequisite(s): SE 201

Co-requisites: **None**

SE 239: Network Programming

3 (3-0-0)

The course teaches the fundamental concepts of communication networks and is concerned specifically with network architectures and protocols. The objective of the course is to allow students to develop a thorough understanding of the architectures of networks and the basic principles and protocols that allow the transmission of data over networks.

Prerequisite(s): SE 120

SE 301: Analysis of Algorithms

3 (3-0-0)

This course examines the design and analyses algorithms with an emphasis on their application in real world environments. Topics include time complexity, space complexity, and optimization strategies for various algorithms. Students will gain experience with sorting, searching, and graph algorithms, as well as dynamic programming techniques. Special focus will be placed on algorithmic problem-solving in real world environments.

Prerequisite(s): SE 215

SE 310: Software Design and Architecture

3 (3-0-0)

The course gives students an understanding of the concept of software architecture and how this phase in the development between requirement specification and detailed design plays a central role for the success of a software system. The students will get knowledge of some well-known architecture patterns, and be able to design, construct and evaluate architecture for software systems. In addition, the students should get some understanding of how the developers' experiences and the technical and organizational environment will influence the choice of architecture.

Prerequisite(s): SE 225

SE 252: Database Management Systems

3 (3-0-0)

The course gives students an understanding of the key concepts of database management systems required in the development of most software applications by introducing the principles of relational database management systems such as basic concepts and architecture, Entity-Relationship data model

and constraints, the use of basic and complex SQL query language, data normalization forms, relational algebra and calculus and transactions and concurrency control.

Prerequisite(s): SE 215

Co-requisites: SE 252L

SE 252 L: Database Management Systems Lab **1 (0-2-0)**

This course covers basic database concepts, conceptual data modeling, relational data model, relational theory and languages, database design, SQL, and introduction to query processing and optimization.

Prerequisite(s): None

Co-requisites: SE 252

SE 314: Operating Systems **3 (3-0-0)**

This course introduces the fundamentals of function, design, and implementation of computer/mobile operating systems. Students will learn processes, threads, concurrent programming, interrupt handling, CPU scheduling and process synchronization, memory management, deadlocks, and file system.

Prerequisite(s): SE 215

Co-requisites: None

SE 322: Internet of Things Application Development **3 (3-0-0)**

This course is designed to provide students with technical knowledge and skills to build Internet of Things (IoT) systems and applications. The course will cover the design of microcontroller-based embedded systems. In addition, it will cover IoT paradigms, including the integration of various components such as sensors, actuators, and communication modules, IoT design considerations, constraints, and development processes for IoT applications in different sectors.

Prerequisite(s): SE 239

SE 324: Web Application Development **3 (3-0-0)**

The course focuses on learning fundamentals of Web-based programming techniques, Web application development and client-server database integration. It provides in-depth coverage of introductory programming principles, various markup languages, client-side scripting, server-side scripting and relational databases. The course also introduces sessions, cookies, and the application of XML in web building.

Prerequisite(s): SE 252

Co-requisites: SE 324L

SE 324 L: Web Application Development Lab **1 (0-2-0)**

Laboratory experiments dealing with Web-based programming techniques, Web application development and client-server database integration.

Prerequisite(s): None

Co-requisites: SE 324

SE 328: Mobile Application Development **3 (3-0-0)**

This course examines the principles of mobile application design and development. Students will learn mobile application development on different platforms. Topics will include designing and building user interface, input methods, data handling, network techniques and URL loading, and, finally, specifics such

as GPS location integration, and REST API communication, along with SQLite database and Firebase integration.

Prerequisite(s): SE 252

Co-requisites: SE 328L

SE 328 L: Mobile Application Development Lab **1 (0-2-0)**

This course constitutes the lab component of the Mobile Application Development course (SE 328). It is meant to provide hands-on training on mobile application design and development. Android will be used as a basis for teaching programming techniques and design patterns related to the development of stand-alone applications and mobile interfaces. Emphasis is placed on the processes, tools and frameworks required to develop applications for current and emerging mobile computing devices that rely on different types of databases including Firebase, SQLite and shared preferences.

Prerequisite(s): None

Co-requisites: SE 328

CSE 250: Introduction to Cybersecurity **3 (3-0-0)**

The purpose of the course is to provide the students with an overview of the field of Cyber Security. Students will be exposed to a wide spectrum of security techniques used to protect information assets, manage risk, and detect and react to threats to information assets. In this module, students will learn about data/system/network protection mechanisms, intrusion detection systems, models of security, cryptography, hashing, authentication and non-repudiation, network system security, attack strategies, malware, secure applications (development), and cyber-security policy.

Prerequisite(s): **SE 239**

SE 390: Internship **(0 CRHs)**

An 8 –week long field training opportunity to allow students to perform discipline related tasks for leading organizations in the respective field of Software Engineering. Students are expected to commit to the framework of the organization and to relate to the general practices and workplace ethics.

Prerequisite(s): SE 324, and 101 CRHs passed and department approval

SE 412: Software Testing and Quality Assurance **3 (3-0-0)**

The course focuses on software verification and validation throughout the software life cycle using different static and dynamic techniques such as inspections, reviews, and testing (functional and structural), levels of testing (unit, integration, system, and acceptance), and testing tools (static and dynamic) using testing and quality assurance standards.

Prerequisite(s): SE 310

SE 354: Software Project Management **3 (3-0-0)**

This course introduces project management concepts, tools, and techniques. It covers the five process groups of project management namely, Initiating, Planning, Executing, Monitoring & Controlling, and Closing. In addition, the course covers how these process groups interact with the different knowledge areas of project management: integration management and project planning, scope management, scheduling, budget control, human resource management, communication management, risk analysis and management, project quality management, and procurement management.

Prerequisite(s): SE 310

SE 423: Software Construction and Processes **3 (3-0-0)**

This course introduces principles and techniques to develop software such that it is more maintainable and evolvable. This implies that the developed software is traceable, easy to understand, and ready for

change. Such qualities are necessary for all software which will have a considerable lifespan and would have additions/changes in their functionality during their lifetimes. The course will discuss the most common design patterns which help in making a software more robust.

Software reengineering will also be introduced since many of the largest software systems are successors of existing systems and in the absence of clear documentation, most of the time, functional details and design choices must be extracted from existing code.

The course will also introduce the concept of functional programming, its differences with imperative programming languages, its uses and its pitfalls. Understanding of functional programming will help students explore a new programming paradigm and broaden their horizon.

Prerequisite(s): SE 412

SE 495: Capstone Project I

3 (0-6-0)

This course is the first part of a two-semester senior-year capstone project. It is intended to complement theory and to provide an in-depth, hands-on experience in all aspects of software engineering. The students will work in teams on projects of interest to the IT sector and will be involved in analysis of requirements, architecture and design, implementation, testing and validation, and project management. In this part students provide a project plan, software requirement specification document, and develop software high-level design.

Prerequisite(s): SE 310, SE 324 or SE 328

SE 496: Capstone Project II

3 (0-6-0)

This is the second part of the capstone project started in SE 495 course. In this part, students develop a software solution based on the low-level design which was produced as a part of SE 495. This includes implementation, testing, managing, and evaluating their final product. Student teams must deliver the executable code, a final report, and present and demonstrate their software solution.

Prerequisite(s): SE 495

SE 481: Ethics and Professional Development

1 (1-0-0)

The course will integrate modules covering ethics, career and professional development, along with preparations for taking the Jahiziyah/ Saudi Engineering Council Exams. The course will introduce professional ethics and compare it with personal ethics and common morality. Professional ethics will be studied within the Engineering context where differentiation between Ethics, Morals and the Law will be discussed. Typical Ethical issues that engineers face such as safety, health, confidentiality and conflict of interest will be covered. The course will also cover professional development lecture series for the students to introduce them to topics and application related to their fields, job market as well as trends in the local and international economies. The students will also be prepared for the Jahiziyah and the Saudi Engineering Council Exams through lectures, discussions and mockup exams.

Prerequisite(s): None

SE 435: Undergraduate Research in Software Engineering

3 (0-6-0)

Students participate in supervised research with a faculty member. Supervised research can be: 1) independent research undertaken by the student (thesis, independent study), or 2) assistance on a faculty member's research project. Students must find a faculty member who is willing to supervise him/her as an assistant on an existing project or as the author of an individual project. The student and the faculty supervisor will complete and sign a research contract which will be submitted to the chair of the Software Engineering Department. Drafting the contract will allow the student to develop ideas about what should be accomplished and understand the scope and expectations of the faculty supervisor.

Prerequisite(s): SE 310, SE 322 or CSE 250, SE 324, SE 328, and Department Chair approval. A GPA of at least 3.0/4.0, and a signed research contract

SE 440: Special Topics in Software Engineering

3 (3-0-0)

This course provides instruction and experience in timely topics related to the design and development of quality-engineered software.

Prerequisite(s): SE 324

SE 441: Telecommunications Software Design

3 (3-0-0)

Formal models for telecommunications software design and analysis. Protocol specification, design and validation. Protocol verification and testing. Conformance testing. Protocol synthesis. Protocol conversion.

Prerequisite(s): SE 239

SE 442: Social Networks for Software Engineers

3 (3-0-0)

Students will learn the fundamental interface, systems, and algorithms concepts in designing social software. The case-based syllabus will cover insights from both research and industry. As a student, the student will contribute to this burgeoning field through a quarter-long, team-based project. Students are required to enter the class with an initial project idea.

Prerequisite(s): SE 324

SE 443: Cloud Computing

3 (3-0-0)

This course will leverage the World Wide Web to fulfill computing needs. It packages applications, computing power, and storage as a metered service similar to a utility. This model is designed to supplant the traditional mechanism of desktop computing in many cases. This course will cover the origin, theory, enabling technology, and hands-on labs for key concepts in cloud computing.

Prerequisite(s): SE 324, SE 239

AI 444: Artificial Intelligence

3 (3-0-0)

In this course, students will learn the foundational principles that drive AI applications and practice implementing some of the AI-enabled systems. Specific topics include machine learning, search methods, game playing, Markov decision processes, constraint satisfaction, graphical models, and logic. Students will be introduced to tools and systems to tackle new AI problems they might encounter in life.

Prerequisite(s): AI 250

CSE 445: Information and Software Security

3 (3-0-0)

This course provides an introduction to the topic of security in the context of computer networks. The goals are to provide students with a foundation allowing them to identify, analyze, and solve network-related security problems in information systems with the emphasis on the engineering aspects of information security and software security issues.

Prerequisite(s): CSE 250, SE 324

SE 448: Blockchain Development

3 (3-0-0)

In this course the students will learn concepts of the Blockchain technology such as business networks, participants, assets, and trusted transactions. They will also learn how to develop a complete Blockchain network solution using up-to-date tools and platforms.

Prerequisite(s): SE 215, SE 239

DSE 449: Data Analytics

3 (3-0-0)

This course prepares students to gather, describe, and analyze data, and use advanced statistical tools to make decisions on operations, risk management, finance, marketing, etc. Analysis is done targeting economic and financial decisions in complex systems that involve multiple partners. Topics include probability, statistics, hypothesis testing, regression, clustering, decision trees, and forecasting. Prerequisite(s): SE 252, STA 212

CSE 451: Secure Software Engineering

3 (3-0-0)

This course involves an in-depth study of the processes and techniques associated with secure software engineering. The objective is to plan, manage, document, and communicate security related aspects of different phases of a secure software development life cycle process to all stakeholders. Topics include secure software development life cycle processes, security requirements and their representation techniques and tools, security requirements engineering processes, secure design principles and guidelines and how to represent them effectively, threat modeling, risk analysis, inspection of requirements, design, and code to identify vulnerabilities, assessing the security posture of a secure software development artifact, secure implementation practices, and security testing techniques.

Prerequisite(s): SE 310, CSE 442

CSE 442: Network Security

3 (3-0-0)

The course will start with an introduction to the security concepts and how the data sent over the network is threatened by illegal activities. This course will discuss how cryptographic algorithms can be used to secure data (confidentiality and integrity). Different protocols which have been developed for securing network communication, along with their weaknesses and strengths, will be discussed. This will enable the students to deploy existing protocols, and design new ones, to make data communication more secure. The students will also understand how different factors in a real-world setup can influence the choice of network security protocols.

Prerequisite(s): CSE 350

CSE 453: Security Risk Management & Control

3 (3-0-0)

This course introduces the principles, methodologies, and frameworks used in managing cybersecurity risks within organizations. Students will learn techniques for identifying, assessing, analyzing, and mitigating security risks affecting information systems and digital assets. The course covers topics such as risk assessment methodologies, threat and vulnerability analysis, security governance, compliance requirements, business continuity planning, incident response, and the implementation of administrative, technical, and operational security controls. Students will also explore industry standards and frameworks used in risk management and gain practical experience through case studies and real-world security scenarios.

Prerequisite(s): CSE 250

CSE 454: Ethical Hacking and Systems Defense

3 (3-0-0)

The course will start with an analysis of various vulnerabilities in an application, system/device or a network protocol (or network) which can be exploited to threaten the data and services of a software system. Using these vulnerabilities, students will learn how to collect information before the attack, gain access, retrieve useful information, keep the access for a period of time, and avoid leaving traces of the attack. Countermeasures for each of the vulnerabilities explored will also be discussed. Students will also learn how to assess the security state of an application/system/network based on the vulnerabilities present in it. The course will include both theoretical and practical aspects: concepts learned in the lectures will be practiced in a closed environment using virtual machines.

Prerequisite(s): CSE 442

AI 455: Generative AI

3 (3-0-0)

This course provides an in-depth exploration of Large Language Models (LLMs) and Generative AI. Students will learn about the theoretical underpinnings, architectures, applications, and limitations of these transformative technologies. The course emphasizes practical understanding, enabling students to implement and fine-tune LLMs for various use cases, including natural language processing, content generation, and advanced reasoning tasks. Key topics include transformers, fine-tuning techniques, model evaluation, and ethical considerations. The course integrates hands-on projects, assignments, and assessments to reinforce learning outcomes.

Prerequisite(s): **AI 347**

SE 461: Game Engine Architecture & Implementation

3 (3-0-0)

This comprehensive course delves into the foundations of designing and implementing game engines. Through hands-on experience with object-oriented game engine scripting languages, used in some game engines, students will also explore event-driven and data-driven programming paradigms. The curriculum covers essential topics such as game engine data structures, graphics concepts, and AI principles. Students will learn key aspects of game development, including asset preparation, sprite and bitmap animation, collision detection, game and level design, pathfinding algorithms, sound and music integration, game input devices, and advanced lighting techniques. This course provides a unique opportunity for students to collaborate on team projects, designing and building their own games or 3D interactive learning environments using a game engine. By the end of the course, students will have a solid understanding of game engine architecture and implementation of advanced game projects.

Prerequisite(s): SE 328

SE 462: Fundamentals of Game Design

3 (3-0-0)

This course introduces students to the foundational elements of game design by exploring how designers invent, test, and improve games. It provides students with fundamental learning opportunities focused especially on concept development, gameplay design, texture mapping, core mechanics, user interfaces, narratives, and storytelling. In this course, students explore the psychology and history of games, employ industry tools like game design documentation (GDD) for requirements engineering and software design and communication methods, and learn from established designers.

Prerequisite(s): SE 310

SE 463: Game Mechanics, Prototyping, and Production

3 (3-0-0)

This course allows students to embark on a comprehensive exploration of the dynamic world of game design by delving into the fundamental principles of game mechanics, offering hands-on approach to understanding game rules, interactions, player motivation, engagement strategies, gaming psychology, narrative design, and systems (e.g. feedback system) that are used mainly to shape the player experience. Through practical exercises, students should learn to translate creative concepts into tangible, playful prototypes to boost their skills in game design and to train them on refining requirements and on problem solving mechanisms. Moreover, this course focuses on the intricacies of game production which provides insights into the iterative development process and steps required for successful post-development and launch stages. It provides a holistic understanding of the game development pipeline, needed to equip students with necessary tools to navigate the complexities of game design from conceptualization to execution.

Prerequisite(s): SE 412

SE 464: Innovative Topics in Immersive Game Development

3 (3-0-0)

This course introduces the art of crafting immersive gaming experiences using extended reality (XR) technologies. Through a series of hands-on projects and guided exercises, students will learn to design and develop captivating virtual reality (VR) and augmented reality (AR) applications. They will delve into the fundamentals of XR design, exploring concepts such as spatial interaction, user interface design, and digital storytelling. Additionally, students will gain proficiency in leveraging XR platforms to create dynamic gameplay mechanics, realistic environments, and engaging narratives. Furthermore, students will explore the integration of XR with cutting-edge technologies such as the Internet of Things (IoT), Artificial Intelligence (AI), or Cybersecurity, enhancing their understanding of the evolving landscape of game development. By the end of the course, students will emerge with a comprehensive skill set and a portfolio of innovative immersive gaming projects.

Prerequisite(s): SE 324

CSE 472: Penetration Testing

3 (3-0-0)

In this hands-on course, students learn to think like attackers to identify vulnerabilities before malicious actors can exploit them. They practice reconnaissance, vulnerability scanning, exploitation techniques, and the safe use of testing tools. Ethical guidelines, scoping agreements, and reporting findings are integral parts of the curriculum. Students emerge with a structured methodology for uncovering system flaws and providing recommendations to strengthen defensive measures.

Prerequisite(s): CSE 442

CSE 444: Web and Mobile Security

3 (3-0-0)

This course focuses on the unique security challenges associated with web applications and mobile platforms. Students examine common vulnerabilities such as cross-site scripting, broken authentication, insecure data storage, and malicious code injection. Topics extend beyond basic weaknesses to include API security, single-page application (SPA) safeguards, mobile application sandboxes, secure session management, and hardened containerized deployments. By mastering these concepts, students will be equipped to build and maintain secure web and mobile applications that protect user data and privacy across multiple platforms.

Prerequisite(s): SE 324, SE 328, CSE 250

AI 447: Deep Learning

3 (3-0-0)

This course introduces the fundamental concepts and techniques of Deep Learning, a subfield of artificial intelligence that uses multi-layer neural networks to learn complex patterns from data. Students will learn the principles of deep neural networks, model architectures, training techniques, and optimization methods used in modern AI systems. The course covers key architectures such as Artificial Neural Networks (ANNs), Convolutional Neural Networks (CNNs), and Recurrent Neural Networks (RNNs), along with concepts such as regularization, transfer learning, and model evaluation. Students will gain hands-on experience in designing, training, and applying deep learning models to real-world problems in areas such as computer vision, natural language processing, and predictive analytics.

Prerequisite(s): AI 347

AI 480: Natural Language Processing

3 (3-0-0)

This course introduces the concepts and techniques used in natural language processing (NLP), including text preprocessing, word embeddings, and language models. Students will explore applications such as sentiment analysis, machine translation, and chatbot development. Projects focus on using modern NLP libraries and frameworks to solve practical challenges.

Prerequisite(s): AI 347

CSE 410: Security Architecture

3 (3-0-0)

This course provides a comprehensive overview of designing and evaluating robust security architectures within enterprise environments. Students move beyond foundational concepts to explore layered defense models, identity and access management frameworks, and Zero Trust Network Access (ZTNA). Topics include integrating cryptographic controls, establishing secure communication channels, leveraging threat intelligence, and applying architecture frameworks such as SABSA or TOGAF. Students will also assess emerging technologies and evolving regulatory requirements to ensure that architectures remain adaptive and forward-looking. Upon completion, they will be able to create strategic, standards-based security designs that protect complex systems against diverse threats.

Prerequisite(s): SE 201, CSE 250

DSE 451: Advanced Databases

3 (3-0-0)

This course introduces advanced concepts, architectures, and technologies used in modern database systems. Students will explore advanced database design principles, query optimization techniques, transaction processing, distributed databases, and database performance management. The course also covers emerging database paradigms such as NoSQL databases, data warehousing, big data storage systems, and cloud-based database technologies. Students will gain practical experience in designing, implementing, and managing advanced database solutions for large-scale and data-intensive applications through hands-on exercises and projects.

Prerequisite(s): SE 252

DSE 452: Data Engineering and Pipelines

3 (3-0-0)

This course focuses on designing and implementing robust data pipelines to automate the flow of data from diverse sources. Students will learn about ETL (Extract, Transform, Load) processes, real-time data streaming, and frameworks like Apache Airflow and Kafka. Practical projects simulate building scalable and efficient pipelines for enterprise-level applications.

Prerequisite(s): DSE 320, DSE 322

SE 400: Theory of Computation

3 (3-0-0)

This course introduces fundamental concepts in the theory of computation. Students will be introduced to formal languages, automata, computability and computational complexity. These include finite automata, Turing machines, grammars, decidable problems, reductive procedures and different kinds of computational problems. The course aims to explore these theoretical concepts to apply on practical issues of interest to software engineering, data science, and AI, for instance, natural language processing, algorithmic development and evaluation of computational efficiency. By the end of this course, students will be able to assess the performance bounds of computing models and their applicability towards modern computing problems.

Prerequisite(s): SE 151, SE 215

DSE 401: Optimization Techniques for ML

3 (3-0-0)

This course delves into advanced optimization methods used in machine learning, such as convex optimization, stochastic gradient descent, and optimization under constraints. Students will apply these techniques to improve machine learning model performance, focusing on real-world challenges in tuning and scalability.

Prerequisite(s): AI 347

AI 462: Product Management for AI

3 (3-0-0)

This course introduces the principles of AI product management, focusing on developing, launching, and managing AI-driven products. Students will learn about the product lifecycle, from concept to market launch, while addressing key challenges such as user needs, ethics, and scalability in AI applications.

Prerequisite(s): AI 250

AI 460: Agent Based Systems

3 (3-0-0)

This course introduces the concepts, principles, and techniques used in designing intelligent agent-based systems. Students will learn about autonomous agents, agent architectures, agent environments, and the interaction mechanisms among multiple agents. The course covers topics such as reactive and deliberative agents, multi-agent systems, cooperation and coordination strategies, communication protocols, decision-making processes, and learning in agent environments. Students will also explore practical applications of agent-based systems in domains such as robotics, smart systems, distributed computing, game environments, and autonomous decision support systems. Through hands-on projects and case studies, students will gain experience in developing and analyzing intelligent agent-based solutions for real-world problems.

Prerequisite(s): SE 215, AI 250

AI 472: Expert Systems

3 (3-0-0)

This course introduces students to expert systems in general and to rule-based systems in specific. Students learn how to build a rule-based expert system in a variety of application areas. They also learn advanced programming techniques which include topics of inexact reasoning, intelligent database management methods, and how to develop a community of expert systems. Students are also given the opportunity to demonstrate their understanding of the technology by building a rule-based expert system that addresses a real-world problem.

Prerequisite(s): AI 250

AI 483: AI in Robotics

3 (3-0-0)

This course focuses on integrating AI with robotics to develop intelligent autonomous systems. Students will study perception, decision-making, motion planning, and control using AI techniques like computer vision, reinforcement learning, and path planning algorithms. The course emphasizes practical applications in robotic systems, including autonomous navigation, object manipulation, and human-robot interaction.

Prerequisite(s): AI 250

AI 475: Game Theory

3 (3-0-0)

Game theory underpins several important recent advancements in AI such as multi-agent reinforcement learning and generative adversarial networks. Applications within computer science include the use of games in automated verification & model checking to model computing systems in an unknown and possibly adverse environment. In AI, games are applied to the analysis of multiagent systems. Recently, with the advent of the internet and e-commerce, many game theoretic questions in the interplay between economics & computing have received extensive attention. These include electronic auctions, & more generally mechanism design questions (inverse game theory) related to finding incentive structures for cooperation between independent entities on the internet. The course introduces students to the theory of non-cooperative games covering both its economic and algorithmic aspects. Topics that will be covered include equilibria, their existence and quality, equilibrium learning and computation.

Prerequisite(s): SE 301

AI 451: AI Tools and Applications

3 (3-0-0)

This course introduces students to widely used Artificial Intelligence tools, platforms, and practical applications across various domains. Students will gain hands-on experience with modern AI technologies and frameworks used for data analysis, machine learning, deep learning, natural language

Software Engineering - CoE & Advanced Computing

processing, computer vision, and generative AI applications. The course covers the use of AI development environments, cloud-based AI services, pre-trained models, and AI-assisted tools for building intelligent solutions. Students will explore real-world applications of AI in healthcare, business, cybersecurity, robotics, and smart systems while considering ethical, social, and responsible AI practices. Through practical exercises and projects, students will develop the skills required to select, utilize, and integrate AI tools to solve real-world problems.

Prerequisite(s): AI 250

Co-requisite(s): AI 347
